Solution Architecture Diagram:

Provide a high-level visual representation of your solution's architecture. Use the structural layout below as a template to map out your Presentation Layer, Application Layer, and Data Layer. Fill in the specific technologies and components for your project directly into the boxes to create your architectural diagram.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	User-facing interface where users register, log in, and interact with the system. Includes the web app, a mobile app, and an admin dashboard for managing users and monitoring activity. Sends requests to the backend via the API Gateway.	React, Tailwind CSS, Flutter, Axios
API Gateway	Single entry point for all client requests. Routes traffic to the correct service, balances load across server instances, enforces HTTPS, rate limiting and request validation, and verifies tokens before forwarding.	Nginx, Express.js, TLS/SSL
Microservices	Independent backend services: the Auth Service handles login, sign-up and token issuing; the Core Logic Service performs business logic, data processing and ML predictions; External API Integrations connect to payment and email providers.	Node.js, Python, JWT, OAuth2, Razorpay, SendGrid
Database	Persistent storage layer. Stores structured user and transaction records, unstructured logs and documents, and uploaded files/media, with regular backups for reliability.	PostgreSQL, MongoDB, AWS S3
